## 4 Abstract

- <sup>5</sup> In September 2021, a significant jump in seismic activity on the island of La Palma
- 6 (Canary Islands, Spain) signaled the start of a volcanic crisis that still continues at
- $_{7}$  the time of writing. Earthquake data is continually collected and published by the
- 8 Instituto Geográphico Nacional (IGN). ...

## 9 Plain Language Summary

Earthquake data for the island of La Palma from the September 2021 eruption is
 found ...

## 12 **1 Introduction**

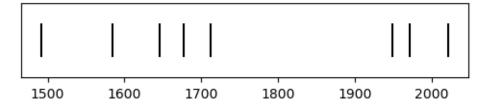

Figure 1: Timeline of recent earthquakes on La Palma

- <sup>15</sup> Source: Article Notebook
- <sup>16</sup> Source: Article Notebook
- Based on data up to and including 1971, eruptions on La Palma happen every 79.8
  years on average.
- <sup>19</sup> Source: Article Notebook
- <sup>20</sup> Studies of the magma systems feeding the volcano, such as Marrero et al. (2019),
- <sup>21</sup> have proposed that there are two main magma reservoirs feeding the Cumbre Vieja
- volcano; one in the mantle (30-40km depth) which charges and in turn feeds a shal-
- <sup>23</sup> lower crustal reservoir (10-20km depth).
- <sup>24</sup> Source: Article Notebook
- <sup>25</sup> Eight eruptions have been recorded since the late 1400s (Figure 1).
- <sup>26</sup> Source: Article Notebook
- <sup>27</sup> Data and methods are discussed in Section 2.
- <sup>28</sup> Source: Article Notebook
- Let x denote the number of eruptions in a year. Then, x can be modeled by a Pois-
- 30 son distribution

$$p(x) = \frac{e^{-\lambda}\lambda^x}{x!} \tag{1}$$

- where  $\lambda$  is the rate of eruptions per year. Using Equation 1, the probability of an
- $_{32}$  eruption in the next t years can be calculated.

Name	Year
Current	2021
Teneguía	1971
Nambroque	1949
El Charco	1712
Volcán San Antonio	1677
Volcán San Martin	1646
Tajuya near El Paso	1585
Montaña Quemada	1492
